

PERFORMANCE SERVICES

You can rely on Experitec to provide comprehensive services

Our project execution process utilizes high-quality, high-impact service engineers to supplement your existing engineering staff

Experitec has expertise in wireless communication and wireless HART.

We have been doing radio/wireless communication for over 15 years. Getting data on your desktop is something we do regardless of the distance. We have provided information on a desktop that can cover hundreds of square miles. We have been engineering and installing wireless IO before the transmitters were developed using Freewave IO radios and other wireless technology. Wireless HART is just an extension of what we do. The years of engineering and field experience with radio and instrumentation give us a leg up on configuring the

Wireless Gateway to the field devices or interfacing the Wireless Gateway to a DCS, PLC or RTU with MODBUS. These skills lend themselves to Wireless HART nicely.

We provide general instrumentation expertise.

We have expertise in calibration, setup, and troubleshooting of Rosemount instrumentation. We may not know every device out there, but we have seen many of them and can leverage our expertise across a broad range of instrumentation.

We are experts in Remote Terminal Units (RTUs).

We have changed out legacy units and installed new

platforms. We can install new units to be part of a remote smart IO platform and connect them to almost any DCS or control system without running wire. Our new 107 and 800 series ROCs are the most versatile on the market and the Bristol Control Wave can be programmed to do almost anything. All three devices have the ability to be programmed using IEC 611313 - function blocks, structured text, etc.

Keep us in mind as you are looking for ways to enhance the operation of your facility. We are available to discuss opportunities or offer support in supplementing your existing staff.
